

I understand the concept to bring fast, cheap internet service to millions of Americans, but this should not be a reason to push thru this technology, at the risk of having it interfere with licensed users of other services (Amateur Radio), that have shown that in time of human and natural disaster that they are needed. If BPL is allowed, then it must be made to understand that if they cause interference they have to correct the problem, but the ones that must know what can happen are the future users of BPL. They must be made aware that Amateur Radio operators or other authorized licensed service can cause interference as the technology is now, and their only recourse is to contact the BPL provider and not the ham.

I think maybe further testing be made before this technology is put out for use, and that the BPL companies show before it's use that it will not interfere with authorized licensed users across the board
